

Parallax Video Plan — Executive Summary

Twenty-video catalogue organised around *persona × specific moment × deliverable*. Each use-case video opens on a real situation the target persona lives in, walks through the Parallax workflow they would actually use, and closes on the artifact they walk away with. Four instructional videos provide foundational onboarding for new users.

At a glance

Tier	Count	Style	Duration	Purpose
0 — Instructional	4 (I1–I4)	Point-and-click utility	60–120s	Onboarding: install, first brief, free tier, exports
1 — Single-feature	6 (V1–V6)	One persona × one tool × one moment	75–110s	“What this feature does for me, in this moment”
2 — Workflow chain	7 (V7–V13)	One persona × 2–4 tools × composite deliverable	2–3 min	“How this fits into my actual workflow”
3 — Hero playbook	3 (V14–V16)	Full multi-tool workflow × publishable artifact	3–5 min	“The most defensible read this platform produces”
Total	20			

Persona coverage:

Persona	Slots	Where
MFO / RIA / wealth advisor	2	V1, V7
Portfolio manager	5	V2, V6, V8, V12, V14
Financial analyst	4	V3, V9, V15, V16
Compliance officer	2	V4, V11
Quant analyst	1	V10
Family-office analyst	2	V5, V13
Audience-general (instructional)	4	I1–I4

Production order: V1 canary → I1–I4 → V2–V6 → V7–V13 → V14–V16.

Tier 0 — Instructional (4 videos)

Audience-general utility content. Point-and-click. Foundational onboarding for new users and prospects.

I1 — Install Parallax

Audience: Any new user / buyer evaluating Parallax for the first time **Duration:** 60–90s **YouTube title:** *How to Install Parallax in Any AI Client (Claude Code, Desktop, Codex, Qwen)*

Prompt typed (same query into all four clients as sanity check): *“Run a quick brief on NVIDIA using Parallax.”*

Why it matters: Foundational gate for every other Parallax workflow. Cross-client portability (4 supported clients, natural-language-prompt-universal) is itself a selling point that distinguishes Parallax from Bloomberg-style proprietary terminals.

What viewers see:

1. **Open hook (~8s):** *“If you’re new to Parallax, here’s the install. Five minutes, any AI client.”*
 2. **Per-client install sequence (~45s):** quad-split or sequenced — Claude Code (full plugin install), Claude Desktop (raw MCP), Codex CLI, Qwen CLI. Voiceover describes each click literally.
 3. **Sanity check (~12s):** the same natural-language prompt typed in all 4 clients — *“Run a quick brief on NVIDIA using Parallax.”* Response renders in each → installation verified.
 4. **Close (~5s):** *“Pick a client. Run an NL prompt. You’re in.”* Outro: *Solve the market.*
-

I2 — First Brief in 60 Seconds

Audience: Just-installed user / first-time evaluator **Duration:** 60–90s **YouTube title:** *Your First Stock Research Brief in 60 Seconds*

Prompt typed: *“Run a quick brief on Microsoft.”*

Why it matters: The 60-second moment of conviction — *“I just typed a question and got an institutional-grade analyst brief.”* Many SaaS trials lose users in the first 5 minutes; this video collapses that gap to one prompt.

What viewers see:

1. **Open hook (~7s):** *“You just installed Parallax. Sixty seconds to your first brief.”*
 2. **NL prompt typed (~10s):** *“Run a quick brief on Microsoft.”* One prompt — no slash command, no config.
 3. **Brief renders (~35s):** parallel calls fire visibly → score panel, factor pillars, trajectory, financial health, bottom line scroll into view. Voiceover paces with the render.
 4. **Close (~5s):** *“One prompt. Sixty seconds. That’s Parallax.”*
-

I3 — Free Tier Walkthrough

Audience: Cost-conscious prospect evaluating before paying for API credits **Duration:** 60–90s **YouTube title:** *What Parallax Does on the Free Tier (No API Key Needed)*

Examples typed: three free-tier queries — a methodology lookup (factor framework definitions), a plugin/docs lookup, and an API health check. Exact phrasing chosen at recording time.

Why it matters: Removes the *“pay before seeing value”* objection. Free tier is a real surface area — methodology drawer, plugin info, free MCP tools. Buyer can validate fit without commitment.

What viewers see:

1. **Open hook (~7s):** *“Curious about Parallax before you pay? Here’s what the free tier does.”*

2. **Free-tier query examples (~50s):** methodology lookup (factor framework definitions), plugin info, API health check. Each query is one NL prompt; voiceover describes what's happening.
 3. **Upgrade transition (~10s):** *"When you're ready for live scoring, deep dives, scenario work — that's the API key."*
 4. **Close (~5s):** *"Free tier first. Upgrade when the methodology checks out."*
-

I4 — Reports & Exports

Audience: Existing or prospective user with downstream workflows in Excel / PowerPoint / shared docs

Duration: 90–120s **YouTube title:** *Export Stock Research to PDF and Excel*

Prompts typed:

- *"Generate a PDF research report on NVIDIA."*
- *"Export peer comparison for NVIDIA to CSV."*

Why it matters: Parallax doesn't replace Excel or the client memo — it feeds them. Buyer eval often hinges on *"can I get the output into my existing workflow?"* Yes.

What viewers see:

1. **Open hook (~10s):** *"Parallax answers in your AI client. But the memo, the deck, the spreadsheet — they're elsewhere. Here's how to bridge."*
 2. **PDF beat (~40s):** NL prompt *"Generate a PDF research report on NVIDIA."* → job ID → render kicks off → PDF download → quick flip through the artifact.
 3. **CSV beat (~35s):** NL prompt *"Export peer comparison for NVIDIA to CSV."* → CSV opens in Excel/Numbers, ready to pivot/sort.
 4. **Close (~10s):** *"Brief in your client. Output in your tools. Solve the market."*
-

Tier 1 — Single-feature use cases (6 videos)

One persona, one specific moment, one Parallax tool, one defensible deliverable. The viewer sees themselves in a real working moment.

V1 — Stock Report (*canary*)

Audience: MFO / independent RIA / wealth advisor **Moment:** *"Client just texted about a holding. Ten minutes before your next meeting."* **Duration:** 90–110s **YouTube title:** *Quick Stock Research Brief*

Deliverable: A quick defensible read on the name — score panel, 52-week trajectory, bottom-line verdict — in under a minute.

Prompt typed: *"Stock brief on NVDA — client query, need a defensible read on the position."*

Why it matters: The moment where speed and defensibility both matter at once. A wrong answer to the client breaks trust; a slow answer makes the advisor look unprepared. Parallax solves both: under 60 seconds, sourceable, score-defensible.

What viewers see:

1. **Open:** moment-setter “*Client just texted about a holding. Ten minutes before your next meeting.*” User types the natural-language prompt; eight parallel calls fire visibly in the chat — framework-consistent.
 2. **Vault stat callout:** “*ICIR 4.10 globally. Plus five-point-eight a year selection return, thirteen years, sixty-two thousand listings across forty-eight markets.*”
 3. **Score panel + factor pillars:** Total Score + 5 factor pillars (Quality / Value / Momentum / Defensive / Tactical) on screen.
 4. **Trajectory:** “*Eight-point-seven to five-point-nine over fifty-two weeks. Quality never moved.*”
 5. **Silent scrolldown:** viewer reads Financial Health / Macro / Dividends / Risk / News / Analyst View on screen.
 6. **Bottom line verdict:** “*Exceptional business at a rich multiple. Factor score cooling. Hold — don’t add.*”
 7. **Closer:** “*Plain English in. Eight parallel calls out. Defensible read in your client’s hand before the meeting starts.*”
-

V2 — Stock Report (Pre-Trade Check)

Audience: Portfolio manager **Moment:** “*Name on the candidate list. Score check before the trade.*” **Duration:** 75–95s **YouTube title:** *Pre-Trade Stock Score Check (Score + Factor Pillars + 52-Week Trajectory)*

Deliverable: Total Score + 5 factor pillars + 52-week trajectory + go/no-go read in under a minute.

Prompt typed: “*Stock brief on [TICKER]. Evaluating for position add — composite score, factor pillars, 52-week trajectory.*”

Why it matters: Pre-trade decision moment. PM has a thesis; needs the quantitative spine to defend the position-sizing call. Score-checking before a trade is the single most-repeated PM workflow.

What viewers see:

1. **Open:** moment-setter VO. NL prompt: “*Stock brief on [TICKER]. Evaluating for position add — composite score, factor pillars, 52-week trajectory.*”
 2. **Score panel reveals:** Total Score + 5 factor pillars on screen. VO interprets: “*Quality and Tactical pinned high. Momentum rolling. Value’s saying it’s expensive — and it is.*”
 3. **Trajectory beat:** score-over-time chart. VO reveals the directionality story.
 4. **Determinism flex:** “*Re-run tomorrow, same score. Same input, byte-identical output. The number doesn’t move on you.*”
 5. **Bottom line:** “*Score supports the size. Add.*” or “*Score’s cooling. Wait.*”
 6. **Closer:** “*Pre-trade score check. Sixty seconds, before you commit.*”
-

V3 — Peer Snapshot

Audience: Financial analyst **Moment:** “*Peer snapshot for the brief. Before it goes out.*” **Duration:** 75–95s **YouTube title:** *Stock Peer Comparison for Analyst Briefs*

Deliverable: Peer-comparison table — factor scores, valuation multiples, momentum, financial health across the comp set — drops straight into the brief.

Prompt typed: “*Peer snapshot on [TICKER] for sector brief — comp set, factor scores, valuation deltas.*”

Why it matters: The analyst’s ad-hoc “*need a fast peer read*” moment. Building a comp table by hand takes 30+ minutes; Parallax produces it cite-able and consistent in under a minute. Saves the analyst’s evening.

What viewers see:

1. **Open:** moment-setter VO. NL prompt: *“Peer snapshot on [TICKER] for sector brief — comp set, factor scores, valuation deltas.”*
 2. **Peer table populates:** table fills column-by-column. VO names what’s striking: *“Quality leader of the group. Two cheapest on Value.”*
 3. **Framework-consistency flex:** *“Same six pillars on every name. Same definitions. Same data feeds. The table actually integrates instead of just being stitched.”*
 4. **Drop-into-brief beat:** visual of copy/export to the analyst’s document.
 5. **Closer:** *“Peer table. One prompt. Sixty seconds. Ready for the brief.”*
-

V4 — Shariah Screen

Audience: Compliance officer (trade/portfolio compliance — Islamic finance / Shariah-mandate sub-specialty)

Moment: *“Shariah-mandate name. Sign-off before close.”* **Duration:** 80–100s **YouTube title:** *Shariah-Compliant Stock Screening (AAOIFI Halal Verdict + Purification Ratio)*

Deliverable: AAOIFI pass/fail verdict + purification ratio + business-screen breakdown + financial-screen breakdown.

Prompt typed: *“Run AAOIFI Shariah compliance screen on [TICKER]. Need pass/fail verdict with purification ratio.”*

Why it matters: Shariah screening is a regulatory requirement for Islamic-finance products. Manual screening is a multi-hour spreadsheet/checklist slog. Parallax produces an AAOIFI-aligned verdict + the exact purification ratio + the underlying evidence trail in under 30 seconds.

What viewers see:

1. **Open:** moment-setter VO. NL prompt: *“Run AAOIFI Shariah compliance screen on [TICKER]. Need pass/fail verdict with purification ratio.”*
 2. **Verdict reveals:** Pass / Fail / Conditional verdict + the headline ratios.
 3. **Drill-down:** VO walks the components — *“Total debt / total assets: under the 33% threshold. Interest income / total revenue: under the 5% threshold.”*
 4. **Auditability flex:** *“Every component cites a source. Every threshold cites a standard. Regulators recognise the methodology.”*
 5. **Closer:** *“Shariah-compliant. AAOIFI-aligned. Sign-off ready.”*
-

V5 — ETF Look-Through Analysis

Audience: Family-office analyst — equity-side exposure read (equity slice only — Parallax does not handle illiquids) **Moment:** *“Half the equity portion is held through ETFs. What are they actually long underneath?”*

Duration: 80–100s **YouTube title:** *ETF Look-Through Analysis: What’s Really in Your Portfolio*

Deliverable: True per-name equity exposure across an ETF-heavy book — compound concentration revealed, underlying factor profile, sector/geo exposure the ETF layer was hiding.

Prompt typed: *“Portfolio analysis with ETF look-through enabled — flag compound concentration, surface true per-name exposure.”*

Why it matters: Family offices and wealth advisors handling ETF-heavy portfolios often don’t know what their clients actually own — the ticker hides the underlying holdings. Two ETFs that look diversified can both be 30% in the same five names. Parallax’s look-through reveals the actual exposure in one query.

What viewers see:

1. **Open:** moment-setter VO. NL prompt: *“Portfolio analysis with ETF look-through enabled — flag compound concentration, surface true per-name exposure.”*
 2. **Surface view:** VO acknowledges what you see at the wrapper level: *“At the ticker level, it looks diversified — six ETFs across six sectors.”*
 3. **Look-through reveals:** the table flips to per-name underlying. *“Two of these ETFs overlap forty-percent on the same fifteen names. Your real top-five exposure is three names, not six.”*
 4. **Factor profile beat:** true factor exposure of the underlying. *“Looks balanced; isn’t. Quality skew but a heavy Momentum tilt — that’s the regime risk you didn’t price.”*
 5. **Closer:** *“ETF wrapper out. Real exposure in.”*
-

V6 — Country Macro Outlook

Audience: Portfolio manager (global / Asia-Pacific / EM mandate) **Moment:** *“Korea election Sunday. Country-level read by Monday open.”* **Duration:** 80–100s **YouTube title:** *Country-Level Macro Outlook (Single-Country Equity Opportunities)*

Deliverable: Single-country macro outlook — regime classification + key indicator readings + sectors-in-favor + rates + FX direction + equity-opportunity shortlist.

Prompt typed: *“Macro analysis on South Korea: current regime, sector positioning, equity opportunities.”*

Why it matters: Country-level macro reads are usually consultant-grade — slow, expensive. When a PM needs a position-shaping country read fast (event reaction, weekly review, fresh thesis), legacy options aren’t built for that timeline. Parallax produces a structured country brief in under a minute, sourced and reproducible.

What viewers see:

1. **Open:** moment-setter VO. NL prompt: *“Macro analysis on South Korea: current regime, sector positioning, equity opportunities.”*
 2. **Regime + indicators:** VO walks the regime call + indicator evidence: *“Mid-cycle expansion. Industrial production accelerating. Inflation cooling.”*
 3. **Sectors in favor:** *“Semis, financials, industrials catching the bid. Consumer staples and utilities lagging — textbook mid-cycle pattern.”*
 4. **Equity shortlist:** names that fit the regime + factor profile, with one-line rationales.
 5. **Closer:** *“Country read. Sectors. Names. Monday morning, you’re positioned.”*
-

Tier 2 — Workflow chain use cases (7 videos)

One persona, one moment, 2–4 chained Parallax tools producing a composite deliverable. Shows the workflow, not just the feature.

V7 — Quarterly Portfolio Review

Audience: MFO / independent RIA / wealth advisor **Moment:** *“Quarterly review with your biggest client tomorrow. Full prep by tonight.”* **Duration:** 2:00–2:30 **YouTube title:** *Quarterly Portfolio Review for Wealth Advisors (Portfolio Health → Rebalance → Client-Ready Output)*

Deliverable: Refreshed portfolio read + rebalance memo + client-ready advisor output (written opinion in email/memo form) — the entire quarterly review packet in one workflow.

Prompt typed: *“Prepare quarterly client review for [client]. Portfolio health flags, rebalance proposal, client-ready written opinion for tomorrow’s meeting.”*

Why it matters: The standing-quarterly-review moment is the highest-stakes recurring touchpoint between an advisor and their UHNW clients. Manual prep is a multi-evening grind across spreadsheets, broker reports, and ad-hoc commentary. Parallax compresses the prep into a 90-minute session and produces an artifact that drops straight into the client conversation.

What viewers see:

1. **Open:** moment-setter VO. NL prompt: *“Prepare quarterly client review for [client]. Portfolio health flags, rebalance proposal, client-ready written opinion.”*
 2. **Portfolio health pass:** Analyzer runs; flagged names surface (score-deteriorating, IPS-breach, concentration). *“Three names slipped a notch — here’s why. One position is now 8% of the book; IPS cap is 5.”*
 3. **Rebalance pass:** trade list + before/after factor profile. *“Trim the over-concentration. Add two names that close the Quality gap. Quality up two points, Value steady, Momentum gently down.”*
 4. **Client-ready output:** *“Advisor output formatted for the client folder. Performance, attribution, rebalance proposal, factor profile — every claim sourced, written in client-facing register.”*
 5. **Closer:** *“Quarterly review, prepped. Walk into tomorrow’s meeting with the artifact in hand.”*
-

V8 — Investment Committee Position Defense

Audience: Portfolio manager preparing for IC **Moment:** *“Investment committee tomorrow. Every position needs a defense.”* **Duration:** 2:15–2:45 **YouTube title:** *Defending Portfolio Positions at Investment Committee (Every Claim Cite-able)*

Deliverable: IC-ready brief — every held position with composite score, factor evidence, methodology drill-down on demand, exception flags.

Prompt typed: *“Investment committee preparation — full book defense. Per-position composite, factor evidence, methodology drilldown for audit trail.”*

Why it matters: The IC defense moment is where PMs get held to account on every position. *“Why are we still in this name?”* is a question the PM must answer with sourced evidence — not gut feel. Parallax provides the evidence chain inline.

What viewers see:

1. **Open:** moment-setter VO. NL prompt: *“Investment committee preparation — full book defense. Per-position composite, factor evidence, methodology drilldown for audit trail.”*
2. **Portfolio pass:** Analyzer surfaces every position with Total Score + 5 factor pillars + recent score delta.
3. **Mock challenge — per-name drilldown:** VO simulates an IC challenge: *“Why are we still in [name]?”* Stock Report opens; methodology drawer reveals the rule that drove the call. **The methodology drawer is the visual hero beat.**
4. **Source-trail beat:** *“Composite eight-point-one. Driven by Quality pillar — earnings stability, ROIC trend, debt service. Click through to the source filings — every input cite-able.”*
5. **Exception flags:** *“These four warrant proactive raising tomorrow before the committee surfaces them.”*
6. **Live-fund flex:** *“This is the engine running Polaris — real capital, not a backtest, since 2019. Same audit trail. Same standards.”*

7. **Closer:** “IC tomorrow. Every position. Every number. Defendable.” — Polaris closer earns this one.

V9 — Full Stock Deep Dive

Audience: Financial analyst (sell-side or buy-side support — end-of-day brief turnaround) **Moment:** “Brief request just landed. End-of-day deadline.” **Duration:** 2:00–2:30 **YouTube title:** Full Stock Due Diligence (11-Call Parallel Deep-Dive Research Brief)

Deliverable: Full single-name due diligence brief — fundamentals, valuation, technicals, scenario context, peer comparison, news synthesis, AI assessment, all reconciling against the same factor framework.

Prompt typed: “Full deep dive on [TICKER]: 11-call analysis, AI assessment, peer context, macro overlay. EOD deadline.”

Why it matters: The full-DD-brief moment is the analyst’s bread and butter. Pulling 11 parallel data feeds and reconciling them — manually, that’s 4–6 hours for a senior analyst. Parallax runs it as one workflow in under three minutes, with everything traceable to source.

What viewers see:

1. **Open:** moment-setter VO. NL prompt: “Full deep dive on [TICKER]: 11-call analysis, AI assessment, peer context, macro overlay. EOD deadline.”
 2. **Eleven-call fan-out:** chat shows 11 parallel calls firing. “Eleven calls. Parallel, not sequential. Each one referencing the same factor framework — they reconcile.”
 3. **Component walkthrough:** VO interprets each component as it lands, naming what’s striking. Multiple sub-beats across composite → financials → scenario → peers → news → AI assessment.
 4. **AI assessment synthesis:** “Eleven inputs. One framework. The synthesis isn’t a chatbot summary — it’s the framework’s verdict, with every input sourced.”
 5. **Closer:** “Brief request in. Brief out. End of day, in hand.”
-

V10 — Point-in-Time Portfolio Analysis

Audience: Quant analyst / data person **Moment:** “Reproduce the regime-window analysis without look-ahead bias. Point-in-time portfolio scoring with historical rebalance dates.” **Duration:** 2:00–2:30 **YouTube title:** Point-in-Time Backtesting for Factor Strategies (No Look-Ahead Bias)

Deliverable: Reproducible point-in-time portfolio analysis — performance metrics, rolling metrics, drawdown analysis, portfolio scores returned for a fixed historical window. Re-run tomorrow against the same fixed dates: byte-identical output.

Prompt typed: “Point-in-time portfolio analysis with start_date = 2021-01-01, end_date = 2023-12-31. Per-holding rebalance dates set to scenario timeline. Need performance metrics, drawdown analysis, rolling factor scores.”

Why it matters: The single most-asked question by quant teams: “Can I reproduce a score AS OF a specific date, with no contamination from later data?” If yes, the platform passes quant due diligence. If no, the quant team walks. This video is the canonical determinism showcase — reproducibility as a property of the workflow, not a marketing claim.

What viewers see:

1. **Open:** moment-setter VO. NL prompt: *“Point-in-time portfolio analysis with start_date = 2021-01-01, end_date = 2023-12-31. Per-holding rebalance dates set to scenario timeline. Need performance metrics, drawdown analysis, rolling factor scores.”*
 2. **Date parameters proof beat:** *“start_date and end_date pinned. Each holding carries its own as-of date. The engine evaluates using only data available as of those dates — no look-ahead contamination.”*
 3. **Regime-window analysis:** performance metrics, rolling metrics, drawdown analysis returned for the window. VO interprets the regime-specific finding.
 4. **Reproducibility flex:** *“Run this tomorrow against the same fixed dates. Same input, byte-identical output. That’s not a backtest accident — it’s a property of how the engine handles historical dates.”*
 5. **Closer:** *“Reproducible. Point-in-time. Audit-grade portfolio analysis.”*
-

V11 — Compliance Sign-Off

Audience: Compliance officer (trade/portfolio compliance — IPS drift, restricted-list, recommendation review)

Moment: *“Signing off on this quarter’s advisory recommendations. Each evidence chain verified before approval.”* **Duration:** 2:15–2:45 **YouTube title:** *Compliance Review for Investment Advice (Evidence Chain Sign-Off)*

Deliverable: Pre-sign-off compliance review — each pending recommendation’s evidence chain (score → factor → input → source) verified inline; exceptions raised and resolved before the advice ships.

Prompt typed: *“Compliance review for sign-off: this quarter’s pending client recommendations. Provide evidence chain per recommendation for review before approval.”*

Why it matters: The compliance-sign-off-on-advice moment is the single highest-stakes regulated workflow in wealth management — MAS, FCA, SEC, HKMA all require defensible evidence chains. Manual sign-off means cross-referencing broker reports and Bloomberg pulls against each proposed recommendation. Parallax produces the evidence chain inline at advice time: every score cites its driving factor + source filing.

What viewers see:

1. **Open:** moment-setter VO. NL prompt: *“Compliance review for sign-off: this quarter’s pending client recommendations. Provide evidence chain per recommendation for review before approval.”*
 2. **Pending advice view:** pending recommendations listed with: client, proposed action, current score, justifying factor pillar, source filing.
 3. **Mock sign-off challenge:** *“Why are we recommending [name] for [client]?”* Stock Report opens. VO walks the chain: *“Composite 8.4. Driven by Quality and Tactical pillars. Methodology drawer open — click through to the underlying filing.”* **The methodology drawer is the visual hero beat.**
 4. **Exception flags:** *“Three of this quarter’s pending recommendations have flagged exceptions. Current score doesn’t quite support the proposed action. Resolve now, before sign-off, not after.”*
 5. **Determinism + LLM-contrast beat:** *“Same input today, same evidence chain. An LLM can’t reproduce this — every answer would be different. Parallax IS the audit trail.”*
 6. **Sign-off action:** approved recommendations move to client delivery; flagged ones return for revision.
 7. **Closer:** *“Every recommendation defends. Every number traces. Signed in one pass.”*
-

V12 — Thesis-to-Portfolio Build

Audience: Portfolio manager (thematic / sector-rotation / factor-tilt strategy) **Moment:** *“Have a thesis. Need a basket. Score-defensible, methodology-traceable.”* **Duration:** 2:15–2:45 **YouTube title:** *Building a Stock Portfolio from an Investment Thesis (Thematic Basket Construction)*

Deliverable: Scored, factor-balanced basket aligned to the thesis — redundancy-checked, defensibility-traced, ready to size.

Prompt typed: “Universe build: high-quality US industrials, small-mid cap, momentum tailwinds, exclude defense. Scored basket with factor balance and redundancy check against existing book.”

Why it matters: The thesis-to-basket moment is where PMs operationalise a tactical view into an investable portfolio. Manual: pulling tickers from broker shortlists, hand-checking factor exposures, hoping no hidden overlaps. Parallax compresses thesis-to-scored-basket into one workflow with redundancy detection baked in.

What viewers see:

1. **Open:** moment-setter VO. NL prompt: “Universe build: high-quality US industrials, small-mid cap, momentum tailwinds, exclude defense. Scored basket with factor balance and redundancy check against existing book.”
 2. **Builder runs:** scored shortlist emerges. “Twelve names match the thesis. Each scored against the same framework — Quality pillar high, Momentum tailwind confirmed, defense exclusion applied.”
 3. **Health pass on each name:** “Three names flag — one has deteriorating financials, one has a sector drift, one is a duplicate exposure.”
 4. **Built-in redundancy check:** “As part of the Builder, redundancy auto-runs on the proposed allocation. Two of the twelve names overlap forty-percent factor-loading with positions you already hold. Adding them would double up the bet, not diversify it.” The differentiator no LLM-only workflow can replicate.
 5. **Refined basket:** “Nine names. Factor-balanced against your existing book. Each defensible against the thesis.”
 6. **Closer:** “Plain English thesis. Scored basket. Ready to size.” — Polaris closer earns this one.
-

V13 — Family Office Equity Onboarding

Audience: Family-office analyst (equity-side analysis only) **Moment:** “New principal. Multi-ETF book just landed. One-page equity exposure read by EOD.” **Duration:** 2:00–2:30 **YouTube title:** Family Office Equity Portfolio Onboarding (ETF Look-Through + Factor + Macro Context)

Deliverable: One-page equity exposure read for principal IC — factor profile, regional/sector concentration, ETF-by-ETF look-through, macro regime context.

Prompt typed: “New client onboarding: full equity portfolio analysis with ETF look-through, factor decomposition, macro regime overlay. Single-page principal-ready output.”

Why it matters: The new-principal-onboarding moment is FOA bread and butter. Family books often arrive ETF-heavy and the FOA is the first person who has to translate “what does this family actually own?” into a defensible read. Parallax’s equity-slice analysis with look-through closes the loop in one workflow. Bounded honestly: illiquid holdings (PE, real estate, direct deals) are outside Parallax’s surface.

What viewers see:

1. **Open:** moment-setter VO. NL prompt: “New client onboarding: full equity portfolio analysis with ETF look-through, factor decomposition, macro regime overlay. Single-page principal-ready output.”
2. **Surface view:** “Twelve positions on the surface. Seven of them ETFs. Without look-through, you can’t tell the family what they actually own.”
3. **ETF look-through:** each ETF’s underlying expanded. “The seven ETFs hold one hundred and forty-two underlying names. Twenty-three of those overlap across multiple ETFs — the real concentration story.”
4. **Deeper ETF beat:** for the largest 2–3 ETF positions, full profile: factor exposure, expense ratio, cheaper alternatives. “This EM ETF — high expense ratio for the exposure. Three cheaper alternatives within ten

basis points of tracking.”

5. **Aggregated factor + macro context:** *“After look-through: heavy Quality tilt, moderate Momentum, light Value. Macro regime: mid-cycle expansion. The factor positioning fits the regime — except for one underweight worth flagging.”*

6. **Closer:** *“New principal. Equity book understood. One page. End of day.”*

Tier 3 — Hero playbooks (3 videos)

Full multi-tool workflow producing a publishable artifact. The most defensible read the platform can produce. Buyer-evaluation flagships.

V14 — Macro Event Response: A PM Playbook (*Iran/Korean Banks anchor*)

Audience: Portfolio manager (discretionary fund — global / Asia-Pacific / EM exposure; event-driven mandate)

Moment: *“Iran war over the weekend. Oil to \$82. Monday open in fourteen hours. What’s the contrarian read?”*

Duration: 3:30–4:30 **YouTube title:** *Macro Event Response: A PM Playbook (Scenario Analysis → Macro Context → Factor Screen → Contrarian Thesis)*

Deliverable: Publishable PM playbook — scenario impact map across the book, macro context for affected and second-order countries, factor-screened contrarian shortlist, synthesised thesis with sourced evidence.

Prompts typed (sequenced across the playbook):

- *“Macro event response: weekend Iran development, oil at \$82/bbl with Hormuz tail risk active. Impact across every position in the book.”*
- *“Macro regime analysis on Korea, Japan, Saudi Arabia, India. Oil-up regime sensitivity per country.”*
- *“Factor screen on Korean banks: Quality + Value composite, oversold technical condition. Need ranked candidates with peer metrics.”*

Why it matters: The macro-event-over-the-weekend moment is one of the highest-stakes PM workflows there is. Monday open arrives in 14 hours; the PM needs a defensible read across vulnerability AND opportunity, with citations for IC. Manual: hours per affected country, gut-feel on the contrarian angle, no time to reconcile. This is the hero piece — direct demonstration of the worked-example anchor (Ivan Cheloliev’s actual Iran/Korean Banks playbook, March 2026).

What viewers see:

1. **Open — the moment:** *“Friday evening. Iran headlines hit. Oil prints eighty-two by overnight. Fourteen hours until Monday open. Every position with energy exposure needs a vulnerability read. And somewhere in the indiscriminate sell-off, there’s a contrarian setup the market won’t price until Tuesday — and you need to find it tonight.”*
2. **Scenario impact across the book:** NL prompt — *“Macro event response: weekend Iran development, oil at \$82/bbl with Hormuz tail risk active. Impact across every position in the book.”* Impact table populates; VO walks the vulnerability story.
3. **Macro context — affected countries:** NL prompt — *“Macro regime analysis on Korea, Japan, Saudi Arabia, India. Oil-up regime sensitivity per country.”* Multi-country regime panel.
4. **The contrarian setup beat:** NL prompt — *“Factor screen on Korean banks: Quality + Value composite, oversold technical condition. Need ranked candidates with peer metrics.”* Five names emerge with metric table. VO frames the contrarian thesis: *“Banks sold off with the indiscriminate Asia-EM trade. But the macro impact on Korean banks is third-order — net-positive if the Won weakens but Korean inflation*

- cools. The factor screen flags five names where the sell-off pushed valuation below long-run average, Quality pillar held, momentum starting to base.”*
5. **Thesis synthesis:** *“Three tools, one framework. Scenario, macro, builder — they reconcile because they reference the same model. The playbook reads like one analyst’s voice, not three tools stitched.”*
 6. **Reproducibility flex:** *“Run this Sunday. Run it Monday. As long as the input is Friday’s close, the playbook is byte-identical. That’s not a backtest property — it’s a workflow property.”*
 7. **Live-fund flex + Polaris closer:** *“Polaris ran a version of this in March 2026. Real capital, real Monday-morning execution. The engine running this playbook is the same engine running the fund.” — Polaris closer.*

V15 — Stock Initiation Report

Audience: Financial analyst (sell-side coverage initiation OR buy-side initiation memo) **Moment:** *“New name handed to you for coverage. IC-grade initiation report, due Friday.”* **Duration:** 3:30–4:30 **YouTube title:** *Building a Stock Initiation Report (Deep-Dive + Scenario + Multi-Philosophy Investor View)*

Deliverable: Full-DD initiation report, IC-grade — fundamentals, valuation, technicals, peer set, scenario risks, multi-philosophy investor view (Buffett / Klarman / Soros / Greenblatt consensus), AI assessment synthesis, published artifact.

Prompts typed (sequenced across the report build):

- *“Initiation report on [TICKER] — full DD: deep dive, scenario stress on key risks, multi-philosophy investor convergence, PDF for IC by Friday.”*
- *“Stress test key risks: sector regime shift, regulatory event, earnings miss scenarios.”*
- *“Multi-philosophy investor analysis — Buffett, Klarman, Soros, Greenblatt. Identify convergence and divergence points.”*

Why it matters: The initiation-report moment is the analyst’s flagship deliverable — the document that defines coverage for the firm. Manual: weeks of work, dozens of broker reports as cross-reference, multiple drafts before signoff. Parallax compresses it to a single end-to-end workflow. The artifact that ships is defensible against the universal LLM-only counter — every claim has a source, every score has a methodology.

What viewers see:

1. **Open — the deliverable framing:** *“New name on your coverage list. Friday deadline for the initiation report — the document that defines how the firm thinks about this name for the next twelve months. Three pages, IC-grade, every claim defensible.”*
 2. **Deep-dive parallel run:** NL prompt — *“Initiation report on [TICKER] — full DD: deep dive, scenario stress on key risks, multi-philosophy investor convergence, PDF for IC by Friday.”* 11 calls fire in parallel.
 3. **Scenario stress beat:** NL prompt — *“Stress test key risks: sector regime shift, regulatory event, earnings miss scenarios.”* Multi-scenario impact populates.
 4. **Multi-philosophy investor convergence:** NL prompt — *“Multi-philosophy investor analysis — Buffett, Klarman, Soros, Greenblatt. Identify convergence and divergence points.”* The four-philosophy view appears. *“This is unique to Parallax. Four legendary investor frameworks, each scoring the same name. Where they agree is conviction; where they diverge is the argument the analyst owns.”*
 5. **AI assessment synthesis:** the integrated read. *“Eleven inputs. Scenario stress. Four philosophies. One framework holding them together.”*
 6. **The artifact:** branded initiation report PDF visible, scrolled. *“Every page, every table, every score — clickable through to source. The published report has the audit trail baked in. An LLM-only initiation report can’t do that — read it, you can’t tell which numbers are right.”*
 7. **Closer:** *“Initiation report. End-to-end. Defensible at every claim.”*
-

V16 — Forensic Earnings Quality Analysis

Audience: Financial analyst (event-driven coverage — earnings response / forensic quality assessment)

Moment: *“Stock fell twelve percent on earnings. Was it the print, or the guide?”* **Duration:** 3:00–4:00 **YouTube title:** *Forensic Earnings Quality Analysis (Was the Sell-Off Justified? Thesis Intact or Broken?)*

Deliverable: Forensic earnings memo — traffic-light verdict (thesis intact / at risk / broken), quality trajectory chart, Palepu-framework forensic flags (accrual anomalies, cash-flow divergence), accounting-news context (auditor changes, accounting-policy notes), AI assessment.

Prompt typed: *“Forensic earnings quality analysis on [TICKER]: 8-quarter trajectory, Palepu-framework forensic checks, accounting-news context, traffic-light verdict for thesis-validation review.”*

Why it matters: The post-earnings forensic moment is high-stakes and time-sensitive. Stock dropped 12% on the print — does the analyst defend the existing recommendation, or pivot? Manual: re-read the call, compare to prior quarters by hand, gut-call. Parallax compresses the forensic into a sourced, traceable memo with a defensible verdict.

What viewers see:

1. **Open — the moment:** *“Earnings hit yesterday. Stock down twelve percent. Phone’s ringing. The PM wants to know if the thesis is intact, the head of research wants the memo before COB, and your existing buy recommendation is going to look stupid if the answer’s no. Forty minutes to know.”*
 2. **Quality trajectory beat:** NL prompt — *“Forensic earnings quality analysis on [TICKER]: 8-quarter trajectory, Palepu-framework forensic checks, accounting-news context, traffic-light verdict.”* Quality trajectory chart appears. *“Quality pillar held seven of the last eight quarters. This quarter cracked — but the crack started Q-minus-three. The print didn’t break the trend; it confirmed a trend that was already there.”*
 3. **Palepu forensic + accounting-news beat:** *“Accruals running fifteen percent above operating cash flow for three quarters running. Auditor changed in Q2. Inventory build outpacing revenue growth. These are the quality-of-earnings flags Palepu’s framework catches — every flag cites the underlying ratio or filing.”*
 4. **Traffic-light verdict:** *“Thesis-at-risk. Not broken — but the trend wasn’t priced in. The post-print sell-off catches the market up to what the forensic was already telling you.”*
 5. **AI assessment + memo synthesis:** *“Forensic quality, accounting news, AI assessment — all reconciling against the same framework. The memo writes itself in the framework’s voice.”*
 6. **Closer:** *“Forty minutes. Sourced verdict. Memo on the head-of-research desk.”*
-

Methodology — what shaped this catalogue

The previous catalogue (28 videos, retired May 2026) was organised by Parallax capability — one video per tool. That approach demonstrated *what each feature does*, but didn’t help the viewer recognise themselves in a working moment. The new slate (20 videos) is organised around persona × specific moment × deliverable. Every use-case video opens on a real recurring situation that a specific buyer-persona lives through, walks them through the Parallax workflow they would actually use, and closes on the artifact they walk away with.

The strategic shift — moments, not features

A feature-organised demo tells the viewer *what the tool does*. A moment-organised demo lets the viewer *see themselves in their own working day*, with Parallax as the response. For fintech buyers (PMs, analysts, compliance officers, family-office analysts, RIAs), conviction comes from recognition: *“that’s my Sunday-*

evening brief panic — and Parallax solves it in 90 seconds.” The catalogue is structured so every video resolves on a moment-of-conviction, not a feature checklist.

This is also a sales-cycle move: capability tours convert poorly on cold buyer eval. Moment-anchored use cases qualify the viewer (the right persona self-identifies in the opening seconds) and pre-frame the buying conversation around a specific recurring pain rather than a generic product walkthrough.

What every use-case video must deliver

Every Tier 1–3 video is built against a four-part contract. If any of these are missing, the video isn’t shippable.

- 1. **Open on a real situation the persona lives in.** Not “today we’ll learn about Parallax Stock Reports.” Instead: “Client just texted about a holding. Ten minutes before your next meeting.” The opening seconds establish *who* the video is for and *when* they’d reach for Parallax.
- 2. **Show the natural-language prompt the persona would actually type.** Plain English; no slash commands, no developer syntax. The buyer should be able to picture themselves typing it. (Instructional videos may show slash commands as a literal install carve-out — every other video is NL-prompt-only.)
- 3. **Cite every number on screen.** Every score, ratio, threshold, and stat traces to a verifiable source — Parallax’s vault, the underlying filing, or the methodology document. Voiceover never makes a claim that isn’t visible on screen or traceable to a source.
- 4. **Close on the artifact the persona walks away with.** A defensible read in hand, a memo on the head-of-research’s desk, an IC packet ready, a basket scored and sized. Resolution, not just exposure.

Three structural moats this catalogue communicates

Every Parallax workflow is constructed around three properties that an LLM-only competitor cannot replicate. The catalogue is sequenced so each moat headlines at multiple videos across every tier.

Moat	What it is	Canonical showcase
Auditability	Every claim cites its source — score → driving factor pillar → underlying input → original filing. Click-through evidence chain at every level	V4 Shariah Screen, V8 IC Defense, V15 Initiation Report
Determinism	Re-run tomorrow against the same input — byte-identical output. No regression, no drift. “The number doesn’t move on you”	V2 Pre-Trade Check, V10 Point-in-Time Backtest, V14 Iran/Korean Banks Playbook
Unverifiable frame	LLM-only competitors can’t reproduce the audit chain — same prompt next week gives a different answer. <i>Parallax IS the audit trail</i>	V11 Compliance Sign-Off, V12 Thesis-to-Portfolio, V15 Initiation Report

The Tier 3 hero playbooks (V14–V16) each showcase all three moats simultaneously — they’re the buyer-eval flagships precisely because they exercise every structural advantage on a single artifact.

Production rules that lock consistency

The 20 videos share a locked craft framework so the catalogue feels like one coherent voice rather than 20 separate productions.

- **Voiceover register:** sober, sourced, second-person. Imperative phrasing in typed prompts (“*Run AAOIFI Shariah compliance screen on...*”); conversational contractions allowed in narration.
- **Visual identity:** 1920×1080, 60fps, navy + orange brand palette, single typeface (Inter). Title card → recording with corner avatar + brand watermark → outro tagline. No variation across videos.
- **Beat sheet upstream of recording:** every video locks its target duration per beat *before* the screen recording happens. The recording conforms to the beat sheet; the beat sheet does not flex to fit the recording. This prevents silent script compression and craft drift across the slate.
- **Avatar treatment:** HeyGen-generated talking head appears in a fixed corner pose throughout the recording body. Persistent secondary signal, not a distraction. Same avatar identity across every video.
- **Closers:** every product demo closes on either “*Solve the market.*” (the standard outro tagline) or — for PM/CIO-targeted cuts — “*This isn’t a backtest. Polaris has been running on these scores since 2019.*” No other closer is sanctioned.

Sequencing — lowest risk first

Production order: **V1 canary** → **I1–I4** → **V2–V6** → **V7–V13** → **V14–V16**.

V1 ships first as the canary. Every downstream production lesson (recording technique, scrub thresholds, conformation discipline, voiceover register, avatar handoff) gets surfaced and resolved on a single 90-second video before the system tries to produce 19 more. Instructional videos (I1–I4) ship next — audience-general onboarding content with lower complexity risk. Single-feature use cases (V2–V6) ship after that, then workflow chains (V7–V13), then the Tier 3 hero playbooks last — by which point every craft rule has been validated in production.

What stayed off the slate

- **Intelligence briefs** (daily / weekly market commentary as standalone videos) are deferred. Infrastructure (template family stub, frontmatter style enum) stays in place for reactivation; the format requires a separate Claude Design session and a per-video vault-sourcing workflow.
- **Capability-only demos** (e.g., “*here’s what the screener tool does*”) are excluded by design. Every video anchors on a working moment. The slate has zero feature-tour videos.
- **Custom avatar twins** (recorded Chicago Global voice + likeness) are not in scope for this catalogue — stock HeyGen avatar + voice ID are used for every video. Maintains brand consistency, keeps per-video cost predictable, avoids dependency on individual on-camera availability.

End of catalogue. Twenty videos, six personas, every flagship Parallax tool represented, three structural moats (Auditability, Determinism, Unverifiable Frame) each headlining at every tier.
